

Certificate management for your RTUs

Safety first

To ensure the highest possible degree of security for the communication of RTUs via public networks, we recommend the use of certificates for the secure authentication of communication partners.

For this purpose, we have set up a comprehensive certificate management with custom-made features to meet all your security requirements. In this context, we prepare, manage and test certificates for OpenVPN, IPsec and TLS, in keeping with the current regulations of BSI TR-02102.

Do you need support for your certificate management? We are happy to help!

Our portfolio includes preparation, administration, documentation and storage of certificates in a secure environment, with strict guidelines and competent staff - if necessary, with the timely exchange of certificates as part of a service contract.

Your sales contact is happy to prepare a tailor-made offer to meet your requirements.

We offer the following services:

Preparation

No matter whether you need one or one hundred certificates: based on a price scale, we are able to prepare a tailor-made offer for you.

Integration

If required, we integrate the certificates into your devices for the use of OpenVPN, IPsec and TLS.

Administration

We guarantee secure archiving and updates, inform you about expiry of certificates and any necessary measures.
